Final Project Proposal: Personal Portfolio

In the beginning of this school year, I officially declared a change of major to Emerging Media with hopes to combine my creativity with my passion for coding. This website will hopefully serve as a portfolio for showcasing my work as a creative coder and my interest in user interfaces. Therefore the primary goal for this website is to communicate my skills in coding, design, and interactivity while also providing an engaging and immersive user experience.

The design will be a build on my midterm project, which was simple but still interesting because of the typography, colors, and responsive layouts. The home page will most likely stay with the same design concept, but I also want to find a way to incorporate my creative statement on the first page and I have not figured out how I will do both yet. Nevertheless, the site will still incorporate subtle transitions, hover effects and a cohesive color scheme. Though, I do want to change from the current color pattern, just so it can be more in tune with the colors I resonate with.

Animation and interactivity will play a key role in the user experience. I plan for each page to feature a live preview or embedded demonstration of the work I've done in other classes, like an interactive p5.js sketch as an example. This will help me with the visual appeal of the site and also show my coding experience/skills. I want my portfolio to be a living project that can

evolve with my skills as I grow on my creative journey and for it to show the blend of art and technology firsthand.
